How to Create an App Password for Gmail

An App Password is a special 16-character password you use for automated scripts or applications instead of your regular Gmail password. This keeps your account secure.

Step-by-Step Guide:

1. **Sign in to your Gmail Account**
   - Open https://myaccount.google.com and log in.

2. **Enable 2-Step Verification** (if not already enabled)
   - Go to **Security** → **2-Step Verification**.
   - Follow the instructions to set it up using your phone or authenticator app.
   - You cannot create an App Password without 2-Step Verification.

3. **Create an App Password**
   - Go to **Security** → **App Passwords** or visit: https://myaccount.google.com/apppasswords
   - You may need to re-enter your password.

4. **Select the App and Device**
   - Under “Select App,” choose Other (Custom name).
   - Enter a descriptive name, e.g., BitLocker Key Delivery Script.
   - Click **Generate**.

5. **Copy the App Password**
   - Google will show a 16-character password.
   - Copy it and **paste it** into the *Password* **parameter** in your Itarian script configuration.

6. **Keep it secure**
   - Treat the App Password like a secret — don’t share it.
   - You can revoke it anytime in your Google account if it’s no longer needed.

Quick Note:

- This password is **only for sending emails from the script**.

- It does not **replace your regular Gmail password**.
