

How to manage virtual desktop in the Endpoint Manager

Introduction

- The 'Virtual Desktop' is a sandbox environment in which you can run programs and browse the internet without fear those activities will damage the host computer.
- Applications in the virtual desktop are isolated from other processes on the host computer, write to a virtual file system, and cannot access personal user data. Changes made to files and settings in the virtual desktop do not affect the originals on the host system.
- Similarly, any attacks by internet based malware cannot reach or compromise the host system. This makes the Virtual Desktop a highly secure environment for general workflows, and specifically for surfing the internet.
- Because the desktop can run any Windows program, admins could use the virtual desktop the default login environment for their users. You can also password-protect the virtual desktop. Users and guests will need to enter the password before they can exit the desktop.

This wiki explains how to configure virtual desktop from endpoint manager:

Step [1]: Go to Endpoint Manager > CONFIGURATION TEMPLATES > Profiles

Select the profile which needs virtual desktop configuration.

For example: Here we are selecting profile "security profile"

Endpoint Manager ☰ Profiles

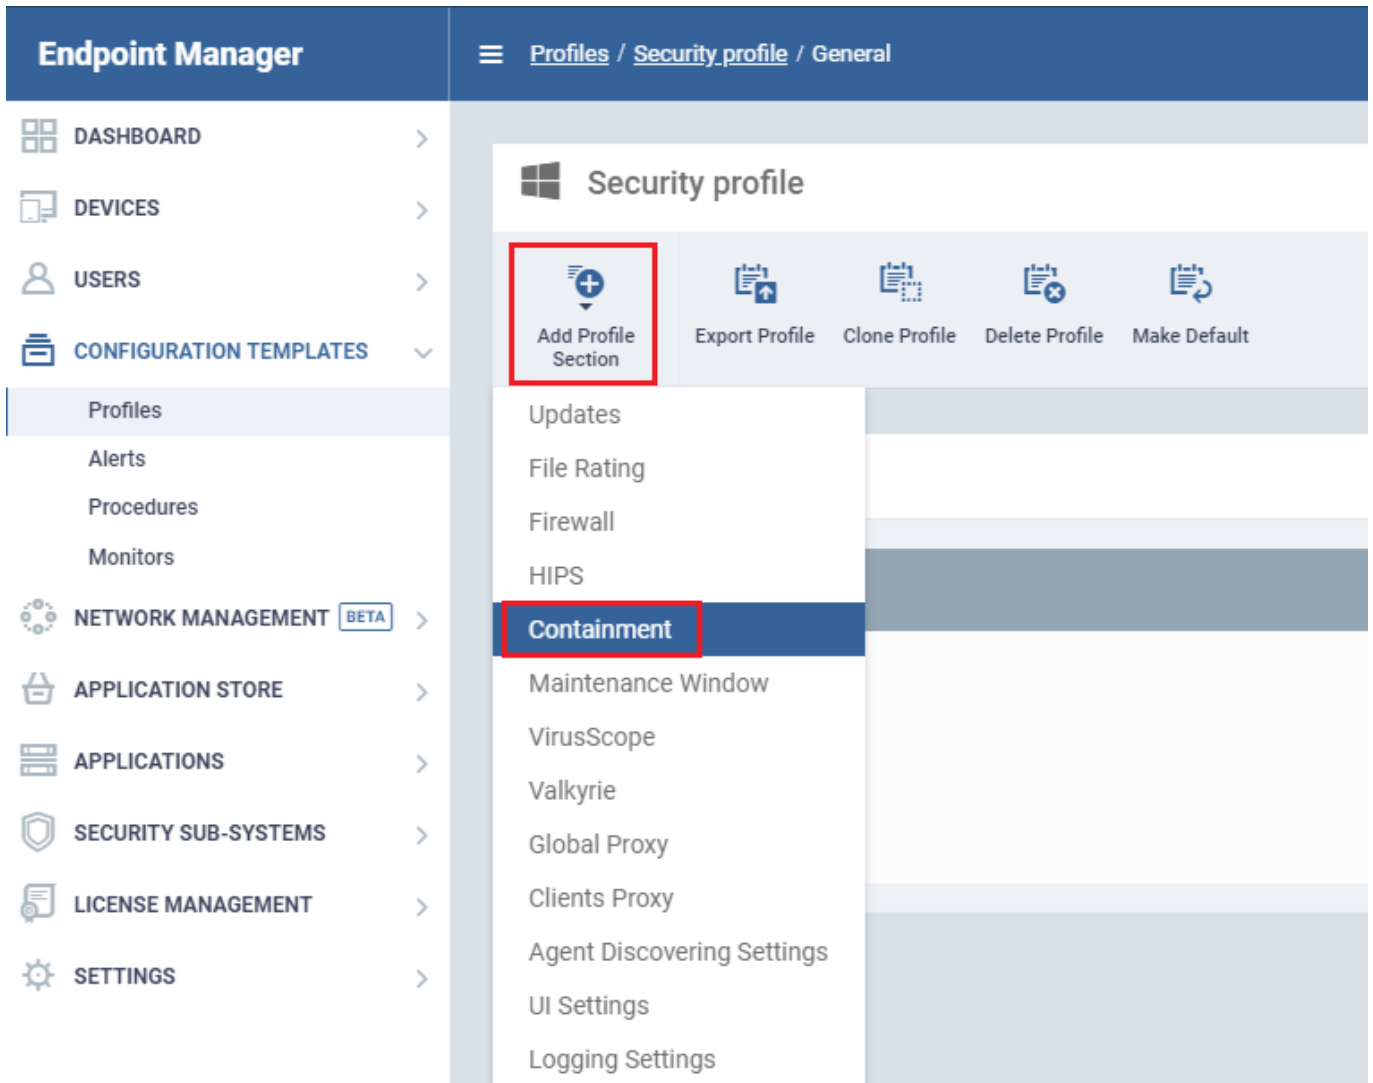

DASHBOARD >
DEVICES >
USERS >
CONFIGURATION TEMPLATES ▾
Profiles (highlighted)

Procedures
Monitors
NETWORK MANAGEMENT BETA >
APPLICATION STORE >
APPLICATIONS >
SECURITY SUB-SYSTEMS >
LICENSE MANAGEMENT >
SETTINGS >

Profiles Default Profiles

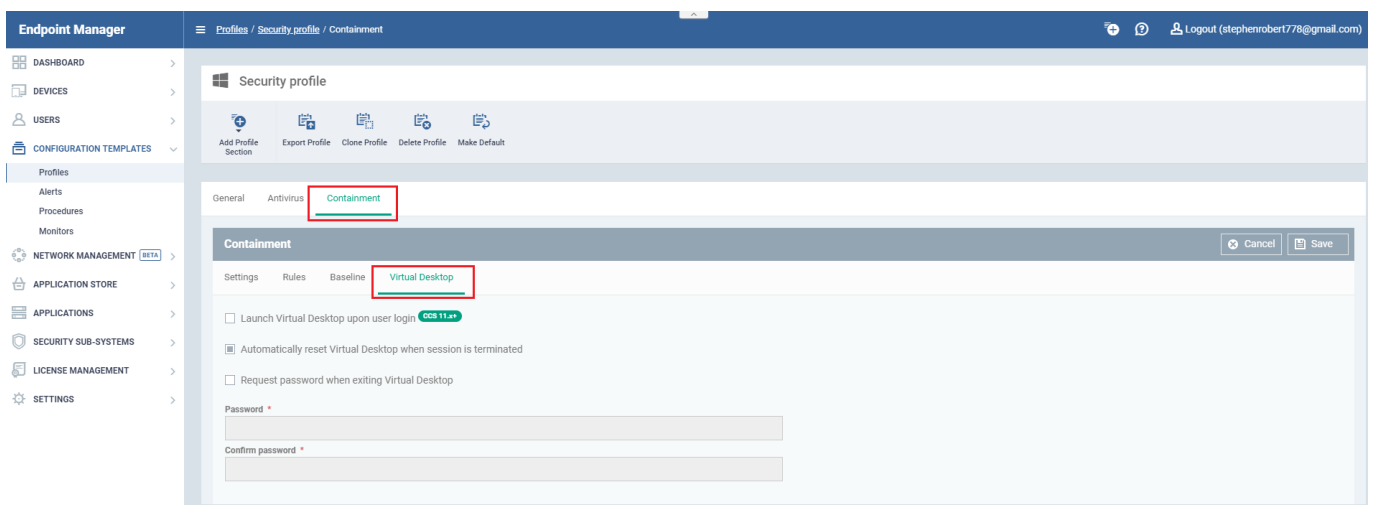

Create Import Export Profile Clone Profile Delete Profile Export

<input type="checkbox"/>	OS	NAME
<input type="checkbox"/>	Windows	Security profile (highlighted)
<input type="checkbox"/>	Windows	Profiles for UI settings
<input type="checkbox"/>	Windows	[cloned] Windows - Security Level 1 Profile v.6.23 vicky
<input type="checkbox"/>	Windows	[cloned] Windows - Security Level 1 Profile v.6.23
<input type="checkbox"/>	Windows	hhhh
<input type="checkbox"/>	Windows	cccc
<input type="checkbox"/>	Windows	ccs profile
<input type="checkbox"/>	Windows	Wins - Security

Step [2]: Click Add Profile Section and select Containment

Step [3]: Select virtual desktop option

- **Launch Virtual Desktop upon user login** - Will automatically run the Virtual Desktop when a user logs in to the system. (Default = Disabled).

- **Automatically reset Virtual Desktop when session is terminated** - Resetting the virtual desktop will remove all user data and undo all system changes made during virtual session.
- **Request password when exiting Virtual Desktop** - Configure an exit password. The exit password prevents guests or users from closing the virtual desktop and accessing the host, potentially exposing the computer to danger. (Default = Disabled)

These actions will be reflected in the endpoint after the profile is added.

For example : Here we are showing ccs requesting password when exiting virtual desktop
